ASPR TRACIE Technical Assistance Request

Request Receipt Date (by ASPR TRACIE): December 11, 2020
Response Date: December 16, 2020; Updated December 21, 2020
Type of TA Request: Complex

Request:

ASPR TRACIE received a request for information related to the approval, allocation, distribution, and administration of vaccines to prevent COVID-19 within healthcare facilities.

Response:

The ASPR TRACIE Team reviewed existing resources, including those in our Mass Distribution and Dispensing of Medical Countermeasures, Influenza Epidemic/Pandemic, Ethics, and Responder Safety and Health Topic Collections and on our COVID-19 Resources Page. We also conducted a search online for relevant materials. Information from these materials are gathered and provided as points for consideration in this document.

The information below is intended to provide high level considerations for vaccination administration and planning in healthcare facilities.

Please refer to the Centers for Disease Control and Prevention’s Coronavirus Disease 2019 webpage and the NIH COVID-19 Treatment Guidelines for the most up-to-date clinical guidance on COVID-19 outbreak management.

I. COVID-19 Vaccine Considerations

Vaccine Development and Approval: Development of a vaccine to prevent COVID-19 has proceeded at an unprecedented pace. Building on years of research on coronaviruses and with the support of purchase commitments from national governments, manufacturers focused on COVID-19 vaccine development and produced several vaccines authorized for use less than a year after the virus was first recognized.

- More than 200 vaccines are in development around the world using various technologies. Some of these technologies have been used in the past to prevent other illnesses, such as live attenuated vaccines for measles, inactivated vaccines for influenza, and protein sub-unit vaccines for pertussis. Some of the most promising COVID-19 vaccines use two newer technologies: viral vector-based vaccines (previously used for Ebola virus disease) and nucleic acid vaccines. The viral vector-based vaccines use well-established technology and elicit a strong immune response, but they are complex to manufacture and there are concerns that previous exposure to the vector may affect effectiveness. Nucleic
acid vaccines – including messenger RNA (mRNA) – are easier to manufacture and have no risk of triggering disease, but had previously only been approved for use in animals and some require ultra-cold storage.

- Each country has its own process for reviewing the safety and effectiveness of vaccine candidates and authorizing their use by the public.
- COVID-19 vaccines will not be administered in the U.S. until they are authorized by the Food and Drug Administration (FDA), likely via an Emergency Use Authorization (EUA). This does not constitute full approval or licensing for the vaccine but allows administration while an emergency declaration is in place when the current evidence favors the known benefit versus risk.
- China authorized the Petrovax vaccine for military use in June 2020 and authorized several other vaccines for emergency use in the months since. The Sinopharm vaccine authorized in China has also been approved by the United Arab Emirates and Bahrain. In August 2020, Russia authorized its Sputnik V vaccine for use. The Pfizer/BioNTech vaccine is the first mRNA vaccine to be authorized for human use for any disease and has been authorized or approved in the United Kingdom, Bahrain, Canada, the U.S., Mexico, Kuwait, Singapore, Jordan, Oman, Costa Rica, Ecuador, Panama, Chile, Switzerland, the European Union, and Saudi Arabia as of December 21, 2020. A second vaccine from Moderna was authorized in the U.S. on December 18, 2020.
- Following its emergency use authorization in the U.S. by the FDA on December 11, the Advisory Committee on Immunization Practices (ACIP) issued an interim recommendation for the use of the Pfizer-BioNTech vaccine in those age 16 and older on December 13, 2020. Similarly, the FDA issued an EUA for the Moderna vaccine on December 18 followed by an interim recommendation from ACIP on December 19 for its use on those age 18 and older. (updated December 21, 2020)
- Section II includes information on the status of vaccines authorized for use in the U.S. and vaccine candidates with promising results in late stage trials for which manufacturers may seek approval in the U.S. in the coming months.

**Vaccine Options:** While experience developing other vaccines suggests that many of the current COVID-19 candidates will not be approved for use, it is expected based on vaccine trials data released so far that several vaccines to prevent COVID-19 will eventually be available (see chart in Section II).

- Neither facilities being shipped vaccines nor individuals who are being vaccinated may receive their preferred product, especially early in the vaccine distribution process when options are limited.
- The anticipated availability of multiple vaccines in 2021 will complicate decision-making for those ordering vaccines. Amounts of each vaccine available, booster dosing, the setting in which vaccines are administered, and the populations needing to be vaccinated will be factors to consider.
- Some vaccines may be more efficacious in certain populations than others. As more data becomes available, those ordering vaccine should maintain awareness of any emerging
differences in effectiveness in specific populations, such as older adults or children, and place orders appropriate to the population they serve.

- As additional options become available, it may be possible to select a product with characteristics more suitable for the setting in which it will be administered. For instance, supplies of vaccine requiring ultra-cold storage are expected to be directed to academic medical centers and large hospitals with the logistical capacity to manage them while vaccines that can be stored at refrigerator temperatures may be more suitable for physician offices or pharmacies.

Supply and Allocation: The initial supply of vaccine will be limited and will continue to grow as additional vaccines are approved and production increases.

- To encourage vaccine development, governments around the world made purchasing commitments that enabled manufacturers to begin producing vaccines prior to the completion of their clinical trials, thereby ensuring the availability of an initial, limited supply upon FDA authorization of each vaccine. Supplies will increase as production continues to ramp up and additional vaccines are authorized.
- Due to the initial limited supplies, a phased approach is necessary to prioritize which segments of the population are vaccinated first. Various governments and organizations have offered frameworks for the fair and ethical allocation of limited vaccine supplies, including the National Academies of Sciences, Engineering, and Medicine, ACIP, and the World Health Organization. Most of these frameworks include considerations for healthcare and other essential workers, older adults, and communities of color that have been disproportionately affected by the COVID-19 pandemic.
- In the U.S., ACIP identified approximately 24 million healthcare workers and residents of long-term care facilities as the highest priority groups for the initial allocation of COVID-19 vaccine during Phase 1a. ACIP met on December 20 to recommend essential frontline workers and those age 75 and older as the next prioritized groups in Phase 1b and other essential workers, those age 65 and older, and those with high-risk medical conditions in Phase 1c. (updated December 21, 2020)
- Of the first 6.4 million vaccine doses available in the U.S., the federal government is holding 500,000 doses in emergency reserve. 2.9 million doses were allocated to jurisdictions pro rata based on their population age 18 and older; the remaining 2.9 million doses will be shipped according to the same allocation for second doses. Shipment of ancillary supplies for the initial allocation to jurisdictions began on December 9, 2020.
- Because the initial supply is not sufficient to vaccinate all persons in ACIP’s highest priority groups, additional sub-prioritization is needed at the state level as well as the sub-state level. For example, every hospital should prioritize the order in which all members of their staff are eligible for vaccination relative to their risk of exposure and risk of severe complications from COVID-19 (e.g., front line staff over the age of 60 who work on the Emergency Department or Intensive Care Units).
• At the current time, there are no specific recommendations for whether individuals who have already had confirmed COVID-19 disease should wait and be vaccinated at a later time.
• Effective prioritization requires an accurate understanding of the total number of persons in each prioritized group in a community/coalition.
• In the U.S., five federal agencies – the Bureau of Prisons, Department of Defense, Department of State, Indian Health Services, and Veterans Health Administration – have been allocated their own supply of vaccine to prioritize among their staff and populations they serve. Additionally, federal agreements allow long-term care facilities to opt-in to having vaccine administered to their residents by CVS and Walgreens. Jurisdictions should consider these federal distribution efforts in their own prioritization decisions.

Transportation and Storage: Vaccines vary in their transportation and storage requirements, ranging from those that may be stored at normal refrigerator temperatures to those requiring ultra-cold storage. It is critical that those ordering vaccine understand the transportation and storage requirements associated with the ordered product and can support those requirements.
• Vaccine coordinators must be pre-identified at each shipping site to receive vaccine shipment and monitor its storage and supply.
• Due to its ultra-cold chain storage requirements, Pfizer developed shipping containers for its vaccine. Vaccine recipients should understand these shipping containers, including their size and weight, how long shipped vaccine can remain in the shipping container, how frequently the container may be opened, how to store vaccine once it is removed from the container, and plan for pelletized dry ice replenishment if required. Each shipment of this vaccine includes 975 doses in multi-dose vials.
• Orders for Moderna and other vaccines are expected to be a minimum of 100 doses per order. Health systems should consider central ordering for their affiliated hospitals, clinics, and other providers. Healthcare coalitions may have a role in coordinating orders and central shipping locations for participants, particularly in rural areas where facilities have limited staff and population served.
• Dry ice is a high demand product due to its use in vaccine shipments on top of its normal uses. Vaccine recipients should identify back-up sources of dry ice and train staff on the safe handling of dry ice. Have dry ice gloves in various sizes readily available.
• Emergency plans should account for the uninterrupted power supply needs of vaccine storage areas and identify generators or other back-up options to protect the vaccine supply in the event of a power outage.
• Many states require their boards of pharmacy to inspect freezers or mandate continuous monitoring of temperatures.

Logistics: In addition to the transportation and storage issues, vaccine distribution and administration involve numerous challenges.
• Vaccine providers must be pre-enrolled to be eligible for vaccine ordering and receipt. This requires outreach to recruit vaccine providers, completion of the enrollment
process, and training on vaccine provider requirements, such as vaccine administration techniques and necessary reporting.

- Sites must be prepared to receive the vaccine itself and the **ancillary supplies** included in each kit. These kits do NOT include sharps containers, gloves, or bandages. Vaccine providers should understand what ancillary supplies will be provided and what additional supplies may be needed to support vaccine administration efforts.
- Security will be needed for both the vaccine storage site and the location where vaccine is administered.
- Each healthcare facility should have a plan that expands the vaccination of staff as supply increases. Various approaches may be used – including vaccinating on the unit/floor, operating a closed point of dispensing, scheduling appointments through occupational health services, or setting up a vaccine clinic – depending on the size of the facility, the number of staff, the amount of vaccine received, and other factors.
- Healthcare facilities should consider their full range of staffing needs. This includes not only vaccine providers, but also staff for planning, vaccine and related supply ordering, transport and storage, security, communications, finance, information technology, and administrative reporting. All staff should be trained on their expected roles.
- Healthcare facilities should review their workforce policies, including determining whether COVID-19 vaccination will be required.
- Use of multi-dose vials requires planning to avoid wastage.
- Vaccines administered under EUA will require the recipient review and provide consent. Ideally, these forms should be made available for review prior to the time of vaccination to speed the process.
- Include health care provider instructions for screening of patient’s eligibility for vaccine based on ACIP contraindications and precautions recommendations.
- Most of the vaccines will require two doses at a different number of days between doses depending on the vaccine. Tracking is needed to ensure that individuals receive both doses of the same vaccine at the correct interval.
- Like in all vaccines, some localized and systemic side effects are expected with vaccines to prevent COVID-19. Healthcare facilities should ensure staff know how to report adverse events, have strategies in place to minimize their impact on operations (e.g., do not vaccinate an entire unit staff at the same time), and have paid time off and return to work policies in place for staff who experience symptoms post-vaccination. **Vaccine administration sites should have medications and supplies in place for the assessment and initial management of anaphylaxis,** a potential rare adverse event following COVID-19 vaccination. (updated December 21, 2020)
- Extensive reporting requirements are in place to track both the vaccine and the vaccinated. Healthcare facilities and providers should understand reporting requirements and ensure systems are in place to support them.
- The success of the COVID-19 vaccination effort is dependent on accurate and effective communications among response partners and risk communication to the public. Healthcare coalitions may have a role in supporting information sharing among
hospitals, clinics, physician offices, long-term care facilities, pharmacies, and other vaccine administration sites to ensure coordinated and equitable vaccine coverage in the community as supply increases. Additionally, consistent and coordinated risk communications can reduce confusion and build vaccine acceptance among the public as vaccine becomes available to other segments of the population.

**Funding:** Because the U.S. government is purchasing vaccines from the manufacturers, members of the public will not be charged for vaccines. However, there are costs associated with the mass vaccination effort.

- While individuals cannot be charged for the cost of the vaccine itself, they may be charged a vaccine administration fee. This administrative cost may be billed to the individual’s health insurer, Medicare, Medicaid, the Children’s Health Insurance Program, or the COVID-19 Uninsured Program.

- The Centers for Disease Control and Prevention (CDC) awarded $200 million to the 64 jurisdictions required to submit COVID-19 vaccination plans yet the CDC Director estimated that $5.5-6 billion would be needed to distribute vaccine. The Adult Vaccine Access Coalition requested $8.4 billion to modernize immunization information systems, recruit and train the immunization workforce, promote mass vaccination, remove financial access barriers, and compensate providers for various costs.

- In addition to billing payers for vaccine administration costs, healthcare facilities and providers should accurately document all expenses related to COVID-19 vaccination planning and response efforts. Reimbursement and cost recovery may be available through the various federal and state programs established with COVID-19 relief funding.
## II. FDA Approved Vaccines and Most Promising Candidates

The vaccine development and approval processes are fluid and information updates frequently. The information in this table is current as of December 21, 2020.

<table>

5 Novavax Announces COVID-19 Vaccine Clinical Development Progress
III. COVID-19 Vaccine Resources

General Vaccine Information

This document identifies access, transparency, equity, efficacy, and safety as the guiding principles for the vaccination of nurses and other healthcare professionals.

This section of the Hospital Operations Toolkit for COVID-19 discusses strategies for hospitals to administer allocated vaccine to their staff.

This Topic Collection helps healthcare professionals and emergency medical planners prepare for the next influenza epidemic or pandemic. The Vaccines section includes resources that are also relevant to the current COVID-19 pandemic.

This Topic Collection provides links to federal, state, local, and tribal programs and resources, lessons learned, plans, tools, and templates, courses, and guidance that can help planners address the need to effectively distribute and administer medical countermeasures (MCMs) to a large number of persons in a short period of time, particularly through mass dispensing efforts led by public health authorities.

This page provides information for healthcare workers on getting vaccinated, preparing patients for vaccination, and finding additional COVID-19 vaccine resources.

This landing page provides information for the public about COVID-19 vaccines, recommendations, administration plans, and safety. It also includes answers to frequently asked questions.

This issue brief identifies key issues related to COVID-19 vaccine distribution. Issues discussed include: funding for vaccine distribution; supply, logistics, and monitoring; federal, state, and local authority over vaccine requirements; insurance coverage and out-of-pocket costs; addressing racial and ethnic disparities; and communication and trust.

Gavi. (2020). There are Four Types of COVID-19 Vaccines: Here’s How They Work.

This page provides an overview of the four different COVID-19 vaccine types in development: whole virus, protein subunit, nucleic, and viral vector.

This statement by 17 organizations offers seven guiding principles related to COVID-19 vaccine. It calls for transparent and scientifically rigorous vaccine development, approval, and post-marketing surveillance processes; equitable allocation of vaccine; consistent and clear public engagement and communication; a well-coordinated national distribution strategy; accounting for the readiness of the local vaccination infrastructure and workforce; prioritization and promotion of COVID-19 vaccination; and ensuring affordability and access.

Vaccine Development and Approval

Bloomberg. (2020). Tracking the Coronavirus Vaccines That Will End the Pandemic.

This page tracks the development status of the most promising COVID-19 vaccine candidates and global purchasing commitments for each.

This landing page provides links to the latest information on the development and approval of COVID-19 vaccines.

This guidance document assists sponsors in the clinical development and licensure of vaccines to prevent COVID-19.

This guidance document assists sponsors in understanding the data and information required to support the issuance of an emergency use authorization for a vaccine to prevent COVID-19.

This graphic illustrates the key steps in the COVID-19 vaccine approval process.

This webpage describes the steps that vaccine developers follow when seeking FDA approval of a vaccine.

London School of Hygiene and Tropical Medicine. COVID-19 Vaccine Tracker.

This frequently updated page provides a summary of vaccine candidates and trial timelines, key attributes of registered trials, a map of planning and ongoing efficacy trials, published safety, immunogenicity, and efficacy data, summary of vaccine distribution information, and frequently asked questions.

This frequently updated page offers data visualizations tracking all COVID-19 vaccines currently in development by their platform and phase of clinical testing. Other visualizations show how vaccines work, describe the phases of development, and illustrate manufacturing scenarios.

This report documents the rationale supporting ACIP’s interim recommendation to use the Pfizer BioNTech vaccine in persons age 16 and older.

This report documents the rationale supporting ACIP’s interim recommendation to use the Moderna vaccine in persons age 18 and older.

This video describes how vaccines are developed, tested, and authorized for use. It features remarks from Dr. Anthony Fauci (National Institute of Allergy and Infectious Diseases), Dr. Moncef Slaoui (Operation Warp Speed), Dr. Stephen Hahn (Food and Drug Administration), and Dr. Robert Kadlec (Office of the Assistant Secretary for Preparedness and Response).

Vaccine Allocation

This tool allows planners to enter the state population of prioritized groups, available COVID-19 vaccine doses, and allocation approach (proportional to population or according to two different vulnerability indexes) to view the distribution of vaccine across counties and population groups.

This page describes the partnership of CEPI, Gavi, and the World Health Organization to make two billion doses of COVID-19 vaccine fairly and equitably accessible to participating countries.

This report provides the rationale of the Advisory Committee on Immunization Practices in recommending that initial, limited supply of COVID-19 vaccine be allocated to healthcare workers and residents of long-term care facilities.

The authors of this article describe a three-phased Fair Priority Model for distribution of COVID-19 vaccine that prioritizes preventing urgent harms earlier. Phase 1 addresses
premature deaths and other irreversible health effects, phase 2 addresses other enduring health harms and economic and social deprivations, and phase 3 addresses community transmission.

The report identifies four ethical principles that guide the Advisory Committee on Immunization Practices’ recommendations for initial allocation of limited COVID-19 vaccine: maximizing benefits and minimizing harms, promoting justice, mitigating health inequities, and promoting transparency.

This consensus study report offers a phased framework based on ethical and procedural principles for equitable allocation of COVID-19 vaccine that reduces severe morbidity and mortality and negative societal effects of the pandemic. In addition to the framework, the authors addressed implementation challenges related to program administration, risk communication and community engagement, vaccine acceptance, and global equity in allocation.

This report offers an ethical allocation framework and suggestions for vaccine distribution. The framework is based on wellbeing and promoting the common good; justice, fairness, and equity; legitimacy, trust, and sense of ownership in a pluralist society; combining and balancing ethical values and principles; adapting to changing conditions and evolving evidence; and linking ethical values and principles with policy goals and objectives.

This roadmap provides guidance on COVID-19 vaccine prioritization decisions within countries based on various epidemiological setting and vaccine supply scenarios.

This framework offers six core principles and twelve objectives to guide the prioritization of groups for COVID-19 vaccination when supply is limited.

**Vaccine Distribution and Administration**

This tool guides the involvement of pharmacists and pharmacy staff in institutional and community COVID-19 vaccine planning efforts. It addresses integration with institutional planning, vaccine supply and distribution, infrastructure, personnel, patient care, vaccine safety monitoring and surveillance, and legislative and regulatory controls.

This checklist offers steps for health departments to take in preparation for the availability of a vaccine to prevent COVID-19.

This online training module provides information to healthcare workers on COVID-19 vaccine approval and safety, storage, handling, administration, and reporting.

This playbook offers information to advise public health departments and their response partners on how to plan and operationalize their COVID-19 vaccination programs.

This page provides guidance to inform vaccination clinic planning. It applies to both routine vaccination clinics as well as those established for emergencies, such as COVID-19. In addition to outlining activities necessary to operate a vaccination clinic, checklists are available for supplies and best practices.

This page includes links to the executive summaries of the COVID-19 vaccination plans of state, territorial, and local public health agencies and their partners.

This page provides answers to frequently asked questions about the Pharmacy Partnership for Long-Term Care Program.

This page describes the Pharmacy Partnership for Long-Term Care Program that enables participating pharmacies to provide COVID-19 vaccination onsite at long-term care facilities.

This toolkit shares best practices for vaccine storage and handling. It includes an addendum focused on COVID-19 vaccines.

This page links to toolkits on COVID-19 vaccine enrollment, coverage, reimbursement, and other information for healthcare providers, state Medicaid programs and Children’s Health Insurance Programs, health insurers, and those helping consumers and beneficiaries.

This document answers frequently asked questions related to COVID-19 vaccination planning.

This alert summarizes the needles, syringes, alcohol prep pads, and personal protective equipment that will be included in ancillary kits accompanying COVID-19 vaccine shipments.

This plan details how the Indian Health Service will prepare for and distribute COVID-19 vaccine to its Direct Service facilities, Tribal health programs, and Urban Indian Organizations.

This issue brief describes a review of the 64 state, territorial, and local jurisdictional immunization program COVID-19 vaccine response plans submitted to the Centers for Disease Control and Prevention. The authors summarize how jurisdictions are identifying priority populations for vaccination, identifying a network of providers to administer vaccines, developing data collection and reporting systems to track vaccine distribution, and planning a communication strategy. Also included are links to all publicly available plans.

This toolkit provides information to counties to inform planning for equitable local distribution of COVID-19 vaccine.

This report analyzes the initial drafts of jurisdictional COVID-19 vaccination plans submitted to CDC to identify key issues and promote promising practices.

This document describes the strategy for distributing vaccine to all Americans, focused on engagement with the public and other stakeholders, vaccine distribution, safe administration, and monitoring distribution and administration.

This graphic displays the vaccine distribution process from manufacturers to delivery sites.

The authors – members of the Working Group on Readying Populations for COVID-19 Vaccines – offer five recommendations to advance public understanding of, access to, and acceptance of COVID-19 vaccines.

This press release announces the ability of UPS to produce up to 1,200 pounds of dry ice per hour to support COVID-19 vaccine storage in U.S. and Canadian hospitals, clinics, and other points of care. It also announces a collaboration with Stirling Ultracold to distribute portable ultra-low temperature freezers to support ultra cold chain requirements in smaller point of care facilities.

This press release announces the Department of Defense’s plan to distribute and administer COVID-19 vaccine to uniformed service members, dependents, retirees, civilian employees, and select contract personnel. It includes links to the Department’s COVID-19 vaccine guidance and vaccine distribution and population schema.

This guidance allows state-licensed pharmacists to order and state-licensed pharmacists and registered pharmacy interns to administer COVID-19 vaccines under the Public Readiness and Emergency Preparedness Act when certain requirements are met.

This press release announces a partnership with pharmacy chains representing 60 percent of the pharmacies in the U.S. to increase the number of COVID-19 vaccinators and vaccination sites available across the nation.

This press release announces the Pharmacy Partnership for Long-Term Care Program through which CVS and Walgreens agreed to provide and administer COVID-19 vaccines on site to residents of skilled nursing facilities, nursing homes, assisted living facilities, residential care homes, and adult family homes as well as long-term care staff not already vaccinated via other efforts.

This press release announces the 37 sites identified by the VA for prioritized vaccination of healthcare workers and veterans residing in long-term care units.

Vaccine Uptake and Safety

This resource offers information to better understand attitudes and behaviors associated with vaccines. It offers strategies on building vaccination acceptance and confidence that will be important to the COVID-19 vaccination effort.

This page offers suggestions for how healthcare providers may answer patient questions about vaccination to prevent COVID-19.

This page includes materials that providers can use to communicate with patients about vaccination to prevent COVID-19. Materials include fact sheets, posters, stickers, slides, social media messages, videos, and communications guides.

This page offers considerations for healthcare personnel with systemic signs and symptoms after receiving a vaccination for COVID-19.

This page offers considerations for residents of long-term care facilities with systemic signs and systems after receiving a vaccination for COVID-19.

This page offers communication strategies to aid healthcare providers in talking with their patients about vaccination to prevent COVID-19.
