ASPR TRACIE Technical Assistance Request

Request Receipt Date (by ASPR TRACIE): 30 April 2020
Response Date: 14 May 2020; Updated 22 May 2020
Type of TA Request: Standard

Request:

The requestor asked for resources related to COVID-19 and secondary disasters, particularly as it pertains to health and medical considerations and need for facilities and communities to shelter-in-place or evacuate during disasters (e.g., hurricanes, tornadoes, and wildfires) while requiring to maintain social distancing practices.

Response:

Secondary disasters (e.g., natural disasters, cyberattacks, large-scale transportation accidents, mass casualty incidents) that strike during the COVID-19 pandemic will further stress the health and medical system and threaten vulnerable residents and infrastructure. Below are considerations for healthcare and emergency management professionals when planning for all-hazard secondary disasters during a public health emergency. Click below to be brought directly to that section.

I. Health and Medical Considerations
   - Telehealth and Utility Loss
   - Medical Care Delivery

II. Healthcare Facility Evaluation

III. Sheltering During the COVID-19 Pandemic
   - Site Selection
   - Infection Control in Shelters
   - Screening
   - Shelter Set Up and Management
   - Food and Water
   - Cleaning/Disinfecting and Waste Management
   - Other Considerations
   - Planning to Shelter during COVID-19

Please refer to the Centers for Disease Control and Prevention’s (CDC) Coronavirus Disease 2019 webpage for the most up-to-date clinical guidance on COVID-19 outbreak management. Visit the ASPR TRACIE COVID-19 page for additional healthcare planning resources.
I. **Health and Medical Considerations**

- Chronic medical conditions are often exacerbated during disasters; affected patients are even more vulnerable during the COVID-19 pandemic due to:
  - The potential lack of medical access (e.g., closed physician offices, no access to telemedicine, and/or no transportation to get medication or needed healthcare service);
  - Refusal to seek medical care due to fears of contracting COVID-19; and
  - Loss of healthcare coverage or access to medication due to the loss of a job.

- Local healthcare providers and emergency management and public health planners should plan for the evacuation and shelter needs of individuals with new and pre-existing medical conditions, which may have worsened due to COVID-19, including patients:
  - With chronic medical conditions
  - With a mental health diagnosis and/or alcohol or drug dependency
  - Whose conditions must be continually managed by prescription medications (e.g., seizure disorders, diabetes)
  - Who are dependent on medical devices
  - Who are on dialysis

- Secondary disasters (e.g., floods, earthquakes, fires) may damage hospitals and other healthcare facilities. A plan must be in place for patients separated from their “medical home” who need continued access to healthcare facilities, services, equipment, medications, and records.

### Telehealth and Utility Loss

- The use of telehealth services has significantly increased during the COVID-19 pandemic. Healthcare providers are conducting virtual visits to conduct patient screening and triage for COVID-19 and influenza-like illness, pre-and post-operative visits, remote patient monitoring for chronic medical conditions, and acute office visits for conditions that can be assessed and treated remotely.

- During a secondary disaster, telehealth services may be an optimal way to reach some patients who have been displaced or may not be able to access a healthcare facility.

- Many secondary disasters, however, will result in potentially wide-scale power outages, loss of internet connectivity, and/or loss of equipment (by both providers and patients).

For More Information:

- ASPR TRACIE COVID-19 and Telehealth Tip Sheet
- ASPR TRACIE Durable Medical Equipment in Disasters
- Planning for Power Outages: A Guide for Hospitals and Healthcare Facilities
- Utility Failures Topic Collection
• Planners and healthcare providers must take into account this increasing reliance on telemedicine when planning for the effect that utility outages would have on virtual healthcare. This must be done in conjunction with more traditional planning for power outages (e.g., sustaining durable medical equipment, and HVAC systems).

• Utility outages will also affect respiratory devices and other critical care equipment vital for COVID-19 patients. Hospitals must ensure that their generator capacity is able to withstand this potential increase in demand.

Medical Care Delivery

• Many emergency departments across the country have reported an approximate 40% decrease in traditional emergent visits during the COVID-19 pandemic. During a secondary disaster, however, injured victims will need to be transported to and cared for in these hospitals.¹

• Some hospitals will already be stressed (resources, staff, and space) due to large numbers of COVID-19 patients and will likely have strict precautions in place for testing, receiving, and admitting additional patients. Those hospitals with lighter loads also need to take these precautions while managing potentially infected victims of a secondary disaster.

• Initial triage and testing will be imperative to keep patients and personnel safe.
  o Many hospitals currently start the screening process outside of the hospital or in the lobby; patients with respiratory symptoms are typically sent to a separate area. In a mass casualty incident, patient screening and triage will need to be done rapidly and there may not be enough time to screen all patients for COVID-19 symptoms, particularly those with critical injuries.
  o All patients will need to be treated as “COVID-possible” and therefore have their temperature taken and provided a mask if feasible. Healthcare providers may need to take extra precautions such as wearing personal protective equipment (PPE) that would typically not be needed when treating mass casualty victims prior to COVID-19.²
  o Testing is important to understand the landscape of new patients, the level of PPE worn by providers, and how medical care will be prioritized and delivered to each patient. Testing can also ensure that patients can safely be sent home or to another facility.

For More Information:
• ASPR TRACIE Family Reunification and Support Topic Collection
• ASPR TRACIE Tips for Healthcare Facilities: Assisting Families and Loved Ones after a Mass Casualty Incident
• CDC Strategies to Optimize the Supply of PPE and Equipment

² CMS has required that all Medicare-certified hospitals with emergency departments are to provide medical screening to all patients that come into the ED.
facility (shelter, skilled nursing facility) upon discharge.

- Patient tracking and reunification is often challenging during natural disasters and mass casualty incidents and may be more so during the pandemic with rules barring visitors due to COVID-19. Hospitals must plan for to conduct these activities virtually.

II. Healthcare Facility Evacuation

Evacuating patients on isolation precautions (e.g., confirmed COVID-19 patients) presents significant, unique challenges to an already challenging process. Lessons learned from past incidents, including the evacuation of Coney Island Hospital (NY) prior to Hurricane Irene, of patients on isolation precautions include the following:3

- Patients should be sent with a printed copy of their discharge summary and an isolation sign, providing a visual cue to the transport team and receiving facility.
- Detailed patient records concerning precautions and receiving facilities should be maintained in the Incident Command Center.
- A designated healthcare provider (e.g., Director of Infection Control) should be assigned to work in the Incident Command Center and have access to the electronic medical records to provide receiving facilities with detailed patient information.
- Medical and nursing staff should accompany patients and work in the receiving facilities for the duration of the evacuation to help provide continuity of care.
- All patient rooms should be terminally cleaned as patients are evacuated.
- When the evacuated hospital reopens, the transfer process is reversed, and the same process is followed with the original hospital becoming the receiving facility.
- Infection control personnel should be stationed on each unit to ensure appropriate patient placement upon their return.

The following considerations for staff evacuating confirmed or suspected COVID-19 patients were taken from the article “Safe Patient Transport for COVID-19”: 4

- All transport staff should wear proper PPE (e.g., N95, face shield, disposable gown, gloves).
- Patient should wear surgical mask.
- Avoid using open breathing circuits or high-flow nasal oxygenation and non-invasive positive treatment during transport.
- Add HEPA filters to endotracheal tubes if bagging is required via bag-valve-mask (BVM) as well as to expiratory limbs of breathing circuits for ventilators.

For More Information:

- CDC Healthcare Infection Prevention and Control FAQs for COVID-19
- CDC Cleaning and Disinfection for Non-emergency Transport Vehicles
- ASPR TRACIE EMS Infectious Disease Playbook

---

• Avoid unnecessary breathing circuit disconnection during transport.
• Prepare transport equipment and drugs in anticipation of medical emergencies such as sudden cardiovascular collapse or hypotension.
• Conduct gentle bagging by BVM to reduce aerosolization in the event of worsening hypoxemia.
• Use pre-planned dedicated transport route to receiving hospitals or other destination.

III. Sheltering during the COVID-19 Pandemic

Shelters that are established during disasters are considered temporary; they are not expected to administer healthcare services in the traditional sense. The Centers for Disease Control and Prevention (CDC) recommend that during COVID-19, alternatives such as sheltering in place, should be considered. If that is not an option, the American Red Cross (ARC) identifies three types of sheltering to consider during secondary disasters in the COVID-19 environment: hotel/dormitory sheltering (preferred if available), using campgrounds as shelters, and congregate shelters. The information provided through the end of this tip sheet focuses primarily on congregate sheltering. More detailed information for each of these sections can be found in the CDC Interim Guidance for General Population Disaster Shelters During the COVID-19 Pandemic.

Site Selection

• When possible, jurisdictions should use alternative facilities such as hotels to provide shelters for localized disasters during a pandemic.
  o CDC recommends hotels/dormitories and small shelters (fewer than 50 residents) to be prioritized over large shelters.
  o Across the U.S., ARC typically has two or three shelters open every night due to a fire, tornado, flood, or other disaster. However, since late March 2020, the ARC has not opened any shelters. Instead, they are placing displaced...
families into hotels or other temporary housing to reduce the transmission of COVID-19.5

- The ARC document Sheltering in COVID-19 Affected Areas provides a detailed description of shelter types and pros/cons as well as general considerations for congregate shelters.
- Supplemental facilities such as military shelters and closed hospitals may also be considered.

- A Federal Medical Station (FMS) is a U.S. Department of Health and Human Services (HHS) deployable healthcare facility that consists of enough equipment and supplies to operate a temporary medical facility and treat 50 to 250 patients within an “appropriate building of opportunity.” Much of this HHS asset and federal medical personnel are currently deployed to respond to the COVID-19 pandemic and therefore may not have the typical availability to respond to a secondary disaster. However, some of these facilities may be able to be utilized if needed as a result of a secondary disaster.

- Emergency managers planning for community evacuations should consider screening evacuees for symptoms of COVID-19, and those with symptoms be placed in separate facilities. The elderly and immunocompromised should be separated as much as possible and housed in similar facilities.6

**Infection Control in Shelters**

- Shelter staff and residents should wear a cloth face covering at all times except when not practical (eating, showering). Cloth face coverings should not be used by children under age 2, anyone who has trouble breathing, is incapacitated or otherwise unable to remove the mask without assistance.

- It is critical to identify potentially infectious or acutely ill individuals to prevent the spread of disease within the shelter. This can be done through triage, and infection prevention and control strategies.
  - Those that are ill or require specialty care should be transferred to a medical facility or alternate care site (ASC) as soon as feasible.
  - When potentially contagious individuals cannot be transferred, shelter staff must implement infection prevention and control interventions to decrease the risk of disease spread within the shelter.

---

5 Almenara, F. (2020). Red Cross Sets Up Temporary Hotel Shelter For Madison Fire Victims. WKOW.

Each shelter should develop a communicable disease assessment plan. Formal assessment and triage should be conducted on sheltered individuals and staff operating the shelter to identify any potential infectious diseases or conditions.

- If possible, an infection control professional or designee should be involved in local and regional emergency preparedness planning and be available for consultation during the secondary disaster due to the potential for infection transmission in shelters. This person should be identified for each shelter and be part of the Incident Command staff. This should be done in coordination with local public health communicable disease officials who may be aware of additional helpful local and regional resources.
  - An infection control professional can assist with the following: developing a shelter needs assessment; identifying disease surveillance needs; performing surveillance; monitoring on-site infection control practices; and intervening during potential infectious disease outbreaks.
- Appropriate hand hygiene should be practiced in all shelters. It is required as an important measure for preventing the spread of pathogens and whenever significant hand contamination is possible.
  - This includes activities involving contact with mucous membranes, blood or body fluids, secretions, or excretions.
  - Hand hygiene should also be practiced after touching inanimate sources, which are likely to be contaminated with virulent or epidemiological important microorganisms.
  - Hand hygiene is particularly crucial following contact with a symptomatic individual.

### Screening

- Shelter staff can use verbal screening and non-contact infrared thermometers for entry screening and place potentially ill evacuees in a separate room.
- CDC recommends that shelter managers should monitor residents daily for symptoms of COVID-19 and other illness, including mental health concerns, and provide a daily status update to the local health department and other relevant agencies.7
- If feasible, local jurisdictions should supply shelters with COVID-19 testing kits to test individuals who may possibly have COVID-19.

---

• If partitions or barriers cannot be in place for screeners, they should use PPE such as facemask, eye protection (goggles, face shield), and disposable gloves.

Shelter Set Up and Management

• The proximity of sheltered individuals and staff in conjunction with a decrease or lack of routine sanitary services can increase the risk of disease transmission. After Hurricane Katrina, overcrowded living conditions contributed to the spread of communicable diseases. Main areas for concern specific to congregating groups in shelters during a pandemic include: crowding, shared spaces, fewer volunteer staff, increased need for PPE, and entry screening.8
  o Provide COVID-19 prevention supplies for staff and sheltered individuals in common areas, such as soap, alcohol-based hand sanitizers that contain at least 60% alcohol, tissues, trash baskets, and, if possible, cloth face coverings that are washed or discarded after each use.
  o Place posters that encourage hand hygiene to help stop the spread at the entrance to the facility, at sinks in restrooms, and other areas they are likely to be seen.
• Individual placement within the shelter should be determined based on triage and syndromic surveillance assessments.
  o Whenever possible, families should be placed together within the shelter, especially those with small children.
  o Sleeping areas (including cots) should be arranged so that individuals are separated by putting a minimum of 6 feet between individual sleeping areas (or cots) to prevent the spread of infections. In addition, sheltered individuals should be instructed to sleep head to toe.
• Shelters should plan for fewer volunteers due to fear of becoming ill, being ill, or caring for an ill loved one.
• Shelters should have one entrance. Anyone entering must be logged in after having their temperature scanned and must answer a series of questions about whether they have any symptoms or have recently had contact with anyone who might be infected.
• Clear markers should be placed on the floor to maintain proper social distancing.
• The shelter should have a designated isolation area for infectious and potentially infectious individuals.
• Shelter areas may be divided into the following areas (this is not an all-inclusive list): kitchen, dining, bathroom, dormitory/sleeping area, common play area, medical/first aid area, and isolation-designated area.

• Cleaning crews should wear appropriate PPE and circulate all day to continuously sanitize the facility.
• Additional rooms may also be created within a shelter to establish further social distancing practices.
  o Immunocompromised individuals should be separated as much as possible or housed in separate facilities.
  o State or local recommendations on occupancy can be used during disasters in which social distancing requirements are needed. Rates may be calculated using existing fire codes or square footage.
  ▪ Example: Buildings under 10,000 square feet use a 25% of fire code occupancy, buildings over 10,000 square feet use 10% of fire code occupancy.9
• Volunteer organizations should provide updated training and guidance to volunteers on specific precautions they should take when setting up and operating shelters during a pandemic.

Food and Water

• During disasters, shelters may experience an increased need for potable and non-potable water. In some secondary disasters, such as a flood or hurricane, the municipal water supply may become compromised. Microbial contamination of water poses a large health risk.
  o In the event of water contamination, safe water reserves must be identified and made available to shelters.
  o Back-up supplies of potable water for human consumption, sanitation, and hygiene are essential to the safe operation of shelters.
• Food must be provided to individuals in shelters during emergencies. However, this can pose an infectious disease risk if food is not stored, prepared, and handled appropriately.
  o Serve pre-packaged meals or individual meals dispensed by food service workers.
  o Cafeteria-style service is preferred over self-service, buffet, or family-style. Maintain a minimum of 6 feet of distance between people of different households.
  o Shelter planners should work with registered dieticians and/or licensed sanitarians when developing written plans for obtaining, storing, rotating, and dispensing food supplies.
  o Services from dieticians and sanitarians should be coordinated and made available through local and state public health agencies and/or community emergency management.

For More Information:
• Red Cross Guidelines for Feeding Operations in COVID-19 Congregate Shelters

Cleaning/Disinfecting and Waste Management

- Disinfection should be done using an EPA-registered disinfectant.
- Local jurisdictions should have standing arrangements for trash management during disasters, including handling medical waste. Shelter planners should work with local emergency management and public health agencies to ensure a multidisciplinary approach.
  - Trash receptacles should be made readily available and emptied on a regular basis.
  - Regulated medical waste (e.g., biomedical waste/body fluids and/or used needles and sharps) should not be mingled with regular trash.
  - The holding area for disposal of waste materials should be kept safe, clean, and free of access by vermin and insects.
  - After trash is picked-up for disposal, the holding area should be cleaned and disinfected to remove accumulated organic material in order to prevent insects, animals, and vermin activity.
- Proper cleaning and disinfection of the shelter environment (e.g., surfaces in sleeping and kitchen areas) are crucial to decrease the risk of disease transmission. Shelter staff should be provided with clear, related guidance and training.

Other Considerations

- If there is a designated play area for children, the shelter should have a written plan and proper staff training for toy storage, monitoring, and cleaning.
  - These areas should be cleaned and disinfected every 4-6 hours.
  - Toys should have non-porous surfaces, which are less likely to become contaminated and can be easily cleaned, disinfected, and dried.
  - Crib mobiles, soft/stuffed toys, hand-held electronic games, and wooden and blow toys should be avoided since they are difficult to clean, disinfect, and dry.
  - Bath or other toys that retain water should be also be avoided because they can harbor germs.
- Some individuals may arrive at the shelter with their pets. Close contact with animals can pose an infection risk if the animal bites or scratches a human.
- Many shelters cannot accept animals because of health and safety regulations. Community disaster plans should include provisions for pet shelters adjacent or close to human shelters if possible.
- Shelter workers should also coordinate with local and state animal rescue agencies to provide shelter for pets.
- Community disaster plans for shelters should also include the following recommendations for pest control:
  - Eliminate sources of food for pests.
  - Eliminate areas for nests, burrows, or breeding grounds.
  - Assess the inside and outside of the shelter for potential entrances for vermin, such as windows with torn or missing screens, doors propped open, standing water, and the like. Seal and eliminate any potential problem areas.
  - Work with a community pest control team/company if needed.
- Community disaster plans should also include post-mortem care. Procedures for handling the deceased are regulated at the local and state level. Shelter staff should coordinate with local, state, and federal disaster planning groups, to include Disaster Mortuary Operational Response Teams (DMORT), local medical examiners, and coroners.
- Clear, concise messaging should be conducted to staff, volunteers, and evacuees during an outbreak. Setting clear expectations and explaining restrictions early can help prevent conflict and emotional distress.
  - Post cough and hand hygiene literature in rooms and ensure adequate supply of product is available for staff.
  - CDC: [Communication – Print Resources](https://www.cdc.gov/mmwr/mmwr-em/index.html).
  - Post the same literature in different languages throughout the facility.

### Planning to Shelter During COVID-19

- In California, the sheltering of evacuees after a secondary disaster may be further complicated because utility companies have shut off power during periods of high winds and dry conditions to keep damaged equipment from sparking fires. Last year, shelters were set up for vulnerable residents during the wildfires for individuals who needed power to run medical equipment.  

In preparation for hurricane season, Pinellas County (FL) began editing their community’s hurricane preparedness pamphlet to include safety guidelines from the CDC. Plans now include considerations for social distancing, use of PPE, and hygiene protocols.11
Pinellas and Hillsborough Counties (FL) are working with shelters now to increase the square footage each evacuee will have to comply with social distancing if a hurricane hits.
Hillsborough County (FL) is also considering adding more schools to their shelter list and other non-occupied facilities, such as vacant hotels, in preparation for hurricane season.12
- Sheltering evacuees in hotels would address social distancing challenges because families/individuals could be placed in individual rooms.
- For their safety, individuals should always seek refuge from a tornado, despite the fear of infection from COVID-19. Proper steps should be taken to ensure people follow CDC guidelines for social distancing.
- Clear communication within the community is crucial. For example, individuals in the storm surge zone should evacuate while others should be encouraged to shelter in place and be prepared for wind, rain, and power outages. Additionally, there may be community members that traditionally rely on shelters during storms/power outages that may not be open due to COVID-19; early communication can allow them to make alternate plans.

Lessons Learned from Recent Tornadoes
The National Geographic highlighted the following case study in their article, What Happens when Natural Disasters Strike During a Pandemic: During the recent tornadoes that hit Tuscaloosa, Alabama, two shelters, located in schools, were opened. Shelter workers advised people to stay 6 feet apart in accordance with CDC social distancing rules. Evacuees were also asked whether they felt ill, and those who said they did were directed to an isolation room near an exterior door. Shelter staff noted that people were honest with their answers. One elderly couple even isolated themselves in a teacher’s lounge.
